Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various and/or cartilage disorders, e.g. arthritis.

Claim 2; SEQ ID NO 375; 648pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the proliferation of chodrocyte cells and a method for proliferation or differentiation of chodrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also be useful in the development and screening of therapeutically useful useful in the development and screening of therapeutically useful medicament for treating a condition responsive to the polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation coff glucose or FRA by skeletal muscle cells, for modulating the uptake of stimulating differentiation of adipocyte cells, for stimulating RESULT 10

| proliferation of or gene expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating sports-related joint problems, associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system conditions which sequence represents a human PRO polymorleotide of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html. Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

2; SEQ ID NO 375; 636pp; English. Claim

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the invention also relates to an antibod which specifically binds to a PRO polypeptide, a method for stimulating the proliferation of the condrocyte cells and a method for proliferation probes, in the condrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, profetate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping in generating a risense my and in gene therapy. The polynucleotides my also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful caseful in the development and screening of therapeutically useful caseful in the development and screening of therapeutically useful caseful in the development and screening of therapeutically useful caseful in the development and screening of therapeutically useful caseful in the development. For stimulating and inhibiting proliferation of studies the stapporting cells of glucose or FRA by skeletal muscle cells, for stimulating differentiation of adipocyte cells, for stimulating various bone and/or cartilage disorders such as sports injunities and cartilage are useful for treating sports-related joint problems, cartilage are useful for treating sports-related joint problems, cartilage disorders which stimulation and conficions which cartilage are useful for treating various mammalian hasmoglobined may benefit from enhanced local immune system cell infilteration. This sequence appresents a buman PRO polypurolectide of the invention. This mission of or the part of the sequence appresents an unitariou from USPTO at segdata.uspto.gov/sequence.html.

Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

Claim 2; Fig 375; 636pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO invention also relates to an antibody which specifically binds to a PRO invention also relates to an antibody which specifically binds to a PRO increasing the presence of a tumour in a mammal (e.g. darenal, uniq, or proliferation or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for company presents, presents, kidnay, cervical and liver tumours). The prolymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating at a trisense RNA and BNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapoutically useful caseful in the development and screening of therapoutically useful caseful in the development and screening of therapoutically useful caseful in the development and screening of the appoint of the proliferation of autibodies are used in preparing a national ending antibodies, such as tumours, for stimulating and inhibiting proliferation of short earling the modification of inner ear utricular supporting cells, for stimulating differation of inner ear utricular supporting early of the proliferation of inner ear utricular supporting cells, for stimulating cells, for inducing endothalial cell tube formation and for treating contributions bone and/or cartilage are useful for treating various mammalian has expensed in proteoglycans of from cartilage are useful for treating various mammalian has each and an early as section in pericyte cells, for modifical or associated disorders such as various thalassasemias and condition. The sequence represents a busing polyunctedic of the in

Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

Claim 2; Fig 375; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the invention also relates to stimulating the classes of tumour necrosis factor-alpha (TMF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adremal, lung, coll, breast, prosence tectal, kidney, cervical and liver tumours). The prolymucleotides are useful in molecular biology, in generating a coll, breast, prosence and gene mapping, in generating of hybridisation probes, in chromosome and gene mapping, in generating a release. RNA and BOO lypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapourical preparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing a cumours, for stimulating and inhibiting proliferation of thuman microvascular endothelial cells, for modulating the uptake of glucose or FPA by skeletal muscle cells or adipocyte cells, for stimulating differentiation of alphocyte cells, for stimulating cells or T-lymphocyte cells, for inducing endothelial cells or adipocyte cells, for stimulating are useful for treating various bone and/or cartilage disorders such as sports injuries and articular cartilage are useful for treating various mammalish hammaled condition. Note: The sequence represents a human PRO polymucleotide in electronic format sequence represents a human PRO polymucleotide in electronic formation. The sequence represents a human PRO polymucleotide in the propertion of sequence represents a human PRO polymucleotide in the propertion of the propertion of the propertion of the propertion of the propertion o

WPI; 2003-900169/82. P-PSDB; ADE22801. Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

Claim 2; Fig 375; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO typeptide, a method for stimulating the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adremal, ing).

CC detecting the presence of a tumour in a mammal (e.g. adremal, ing).

CC colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, in generating the probability of the polymore of the polymore of the properties may also a traisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of the properties or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or stimulating differentiation of adipocyte cells, for stimulating differentiation of angipocyte cells, for stimulating cells or T-lymphocyte cells, for stimulating differentiation of adipocyte cells, for stimulating and condition and cells or artings and carthriles and an and/or cartilage defects, osrecarthriles and rhematoid athritis. PRO collegations of inner ear utricular such as sports injuries and articular cartilage are useful for treating various mammalian has modelles are also useful for treating various mammalian has modelles are also useful for treating various mammalian has modelles are also useful for treating various mammalian has modelles and numan PRO polypeptide of the

2003-875636/81 P-PSDB; ADD78919 New isolated, secreted and transmembrane PRO polypeptides and nucleic acids, useful for the diagnosis, prevention and/or treatment of tumors, such as lung, colon, breast, prostate, rectal, cervical and/or liver

Claim 2; Fig 375; 637pp; English

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO invention also relates to an antibody which specifically binds to a PRO invention and so relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tunnur in a mammal (e.g. adremal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tunnours). The polymucleotides are useful in molecular biology, in generating to pypridisation probes, in chromosome and gene mapping, in generating the proliferation probes, in preparing PRO polypeptides by recombinant techniques and in the development and screening of kencaptured screening and inhead in preparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or medicament for treating a condition responsive to the polypeptides or antibodies are used in preparing of human microvascular endothelial cells, for modulating the uptake of stimulating differentiation of or gene expression in pericyte cells, for stimulating confideration of organ expression in pericyte cells, for stimulating the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for stimulating confideration of inner ear utricular supporting cells, for stimulating the proliferation of inner ear utricular such as sports injuries and articular cartilage are useful for treating various mammals or treating various mammals and condition. This cells, for modulation and for treating eare useful for treating various mammals and condition. This sequence encodes a human PRO polypeptides of the invention. Note: The sequence concedes a human PRO polypeptide of the invention. The sequence concedes a human PRO polypeptide of the invention of the useful for treating various ma

Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various and/or cartilage disorders, e.g. arthritis.

Claim 2; SEQ ID NO 375; 636pp; English.

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the release of TNF-alpha from human blood, for modulating the uptake of glucose or FRA by skeletal miscle cells or adipocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the release of proteoglycans from cartilage, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the proliferation of T-lymphocyte cells, for stimulating the release of a cytokine from PBMC cells, for inhibiting the binding of

CC A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte cells, for stimulating proliferation of endothelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, prostate, rectal, cervical or liver tumour. The oligonucleotide probes are useful for isolating genomic and cDNA nucleotide sequences or contisense probes. (I) is also useful as therapeutic asequences or cc antisense probes. (I) is also useful as therapeutic asequences or in assays to identify other proteins or molecules involved in binding in assays to identify other proteins or molecules involved in binding cc and gene mapping, in generation of antisense RNA and DNA, in the crockout animals which in turn are useful in the development and cc knockout animals which in turn are useful in the development and cc screening of therapeutically useful reagents, in gene therapy, for chromosome identification, as chromosome marker, and for generating corposes. An anti-(I)-antibody is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, itssues or serum, and for diffinity purification of PRO from recombinant cell culture or natural csources. (I) and (II) are useful for tissue typing. This sequence encodes or novel human secreted and transmembrane PRO polypeptide. 540 120 120 180 180 240 240 300 300 360 360 420 420 480 480 540 900 660 9 9 241 CACCTTCCCCAAAGCTATGGACAACGTGACGGTCCGGCAGGGGGAGGGGAGCGCCACCCTCAG 301 GIGCACTATIGACAACGGGGTCACCCGGGTGGCTGGCTGAAACGGCAGCACCATCCTCTA 541 CAAAATTGTAGAGATTTCTTCAGATATCTCCATTAATGAAGGGAACAATATTAGCCTCAC 541 CAAAATTGTAGAGATTTCTTCAGATATCTCCATTAATGAAGGGAACAATATTAGCCTCAC CTGCATAGCAACTGGTAGACCAGAGCCTACGGTTACTTGGAGACACATCTCTCCCAAAGC GITGIGICCTICAGCAAAACAGIGGATITIAAAICTCCTIGCACAAGCTIGAGAGCAACAC 1 GTTGTGTCCTTCAGCAAACAGTGGATTTAAATCTCCTTGCACAAGCTTGAGCAACAC 121 AAGAAAAAATCATGAAAACCATCCAGCCAAAAATGCACAATTCTATCTTTGGGCAAT 181 CTTCACGGGGCTGGCTGCTGTGTCTCTTCCAAGGAGTGCCCGTGCGCAGCAGGAGTGC 241 CACCTTCCCCAAAGCTATGGACAACGTGACGGTCCGGCAGGGGGGAGAGCGCCACCCTCAG TGCTGGGAATGACAAGTGGTGCCTGGATCCTCGCGTGGTCCTTCTGAGCAACACCCAAAC 361 IGCTGGGAATGACAAGTGGTGCCTGGATCCTCGCGTGGTCCTTCTGAGCAACACCCAAAC GCAGTACAGCATCGAGATCCAGAACGTGGATGTGTATGACGAGGGCCCTTACACCTGCTC 421 GCAGTACAGCATCGAGATCCAGAACGTGGATGTGTGTGACGAGGGCCCTTACACCTGCTC GGTGCAGACAGCCACCCAAAGACCTCTAGGGTCCACCTCATTGTGCAAGTATCTCC 481 GGTGCAGACAACCACCCAAAGACCTCTAGGGTCCACCTCATTGTGCAAGTATCTCC 121 AAGAAAAAAATCATGAAAACCATCCAGCCAAAAATGCACAATTCTATCTCTTGGGCAAT 181 CTTCACGGGGCTGCTGTGTGTCTCTTCCAAGGAGTGCCCGTGCGCAGCGGAGATGC 301 Grecactarreachaccesercaccessrescorescratecraccaccarcara Gaps . 100.0%; Score 1679; DB 1; Length 1679; 100.0%; Pred. Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various and/or cartilage disorders, e.g. arthritis.

Claim 2; Fig 375; 636pp; English

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymuclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the presence of a tumour in a mammal (e.g. darenal, lung, proliferation or differentiation of chondrocyte cells and a method for proliferation or differentiation of chondrocyte cells and a method for conducting the presence of a tumour in a mammal (e.g. darenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymuclectides are useful in molecular biology, including uses a hybridisation probes, in chromosome and gene mapping, in generating colon, breach preparing PRO polypeptides by recombinant techniques and in a generating either transgenic animals or knock-out animals which are useful in the development and screening of knock-out animals which are useful in the dave-lopment and screening of knock-out animals which are useful as tumours, for stimulating or methodicals are used in preparing a matibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of stimulating differation of anothelial cells, for stimulating differation of inner ear utricular such as sports injuries and carthritis. PRO collegation of inner ear utricular such as sports injuries and a arthritis. PRO collegation of inner ear utricular such as sports injuries and a various bone and/or cartilage disorders such as stimulation and for treating cells. For concartilage are useful for treating various mammalian hemoglobin-cented disorders such as various thalassaemias and condition. Propeptides are useful for treating various mammalian hemoglobin-cented are presented as various thalassaemias and condition. The sequence dara for this patent is also each immune system cell infilteration. Whe sequence terms are properti

New genes, and its encoded secreted and transmembrane polypeptides, useful for treating e.g. lung or breast tumors, osteoarthritis, rheumatoid arthritis, obesity, diabetes, hyperinsulinemia, hypoinsulinemia or wounds.

Claim 2; SEQ ID NO 522; 459pp; English.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal to the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide. A PRO extracellular domain with or without its associated signal peptide. A PRO included are nucleic acids encoding the PRO proteins of mentioned above, a vector comprising PRO, a chimacric molecule comprising proteins and producing PRO, a chimacric molecule comprising of the ellipseptide is useful for detecting PRO FRO included in a sample suspected of containing PRO/993 polypeptide in a sample suspected of containing PRO/993 polypeptide in a sample suspected of containing PRO/993 polypeptide is useful for inking a pro/1959 polypeptide is useful for detecting PRO/150 polypeptide. PRO/150 polypeptide is useful for inking a projective molecule to a cell expressing PRO/370 polypeptide; PRO/370 polypeptide is useful for inking a bioactive molecule to a cell expressing PRO/370 polypeptide; PRO

```

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the prosliferation or differentiation of chondrocyte cells and a method for the proliferation of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidhey, cervical and invertumours). The prolymucleotides may also hybridasation probes, in chromosome and gene mapping, in generating colon, breast, prospating RND and in gene therapy. The polymucleotides may also hybridasation probes, in chromosome and gene mapping, in generating colon proparing RND and in gene therapy. The polymucleotides may also consistent and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development is timulating a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing of funces or antibodies are used in high ting proliferation of gene expression in pericyte cells, for stimulating differentiation of adipocyte cells, for stimulating coliferation of inner ear utricular supporting of the proliferation of inner are utricular supporting cells or T-lymphocyte cells, for stimulating differentiation of adipocyte cells, for stimulating and confitting proliferation of inner are turicular supporting ear useful for treating sports related joint problems, articular cartilage defects, osteoarthatics and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian hamoglobin-capting a human PRO polypeptide of the invention. Note: The concentration of 3 Gao New PRO nucleic acid, useful for manufacturing a medicament for diagnosing or treating tumor, for chromosome mapping or for tissue Baker KP, Beresini M, Deforge L, Desnoyers L, Filvaroff E, Ge Gerritsen ME, Goddard A, Godowski PJ, Gurney AL, Sherwood S; Smith V, Stewart TA, Tumas D, Watanabe CK, Wood WI, Zhang Z; Claim 2; Fig 375; 638pp; English. The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, coping the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prosetate, rectal, kidney, cervical and liver tumours). The prolymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating a hybridisation probes, in chromosome and gene mapping, in generating of polymucleotides may also a traisense RNA and BNA and in Gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of the properties or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or fracting and inhibiting proliferation of thuman microvascular endothelial cells, for modulating the uptake of stimulating differentiation of adipocyte cells, for stimulating differentiation of inner ear utrivinal responsive cells, for stimulating and condition and for treating earthalists. PRO polypeptides which stimulate sports injuries and articular cartilage are useful for treating various mammalish hasmoglobin-associated disorders such as various thalassaemias and condition. Propreptides are also useful for treating various mammalish hasmoglobin-associated disorders such as various thalassaemias and condition. Propreptides are also useful mammales of prome propresents a human

Gao

polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the problemation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridistion probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also antisense RNA and DNA and in gene therapy. The polymucleotides may also consistent in the development and screening of therapeutically useful cragent in the development and screening of therapeutically useful cragent in the development and screening of therapeutically useful cragents. The RNO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for adipocyte cells, for antibodies, such as tumours, for stimulating and inhibiting proliferation of stimulating differentiation of adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating correspondent of or gene expression in pericyte cells, for stimulating craftlage and/or cartilage disorders such as sports injuries and cartilage defects, osteoarthritis such as sports injuries and cartilage defects, osteoarthritis and rheumachoid arthritis prolipeptides are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and conditions which may benefit from enhanced local immune system cell influrance associated disorders such as various thalassaemias and conditions. The sequence represents a human PRO polymucleotide of the invention. Note:

The sequence represents a human PRO polymucleotide of the invention. Sorting to the propertion of this patent is also available in electronic format in the sequence represents.

Two hundred and seventy five nucleic acids encoding PRO polypeptides, useful for treating pericyte-associated tumors, diabetes and various bone and/or cartilage disorders, e.g. arthritis.

Claim 2; Fig 375; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the release to the stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mamal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also antisense RNA and DNA and in gene therapy. The polymucleotides may also cantisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful consecuted in preparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of consecuted cells, for stimulating differentiation of adipocyte cells, for stimulating cells or stimulating differentiation of adipocyte cells, for stimulating

ö 540 9 900 99 999 720 720 780 840 the proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobinassociated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polymucleotide of the invention. Once: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html. 360 360 420 420 480 480 540 120 180 180 240 240 300 300 9 9 661 GGTTGGCTTTGTGAGTGAAGACGAATACTTGGAAATTCAGGGCATCACCCGGGAGCAGTC CTGCATAGCAACTGGTAGACCAGAGCCTACGGTTACTTGGAGACACATCTCCTCCCAAAGC GGTCACCGTGAACTATCCACCATATCAGAAGCCAAGGGTACAGGTGTCCCCGTGGG CAAAATTGTAGAGATTTCTTCAGATATCTCCATTAATGAAGGAACAATATTAGCCTCAC AGGGGACTACGAGTGCCTCCAATGACGTGGCCGCCCCCGTGGTACGGAGAGTAAA 241 CACCTTCCCCAAAGCTATGGACAACGTGGCGGCAGGGGGGGAGAGCGCCCTCAG GGTTGGCTTTGTGAGGTGAAGACGAATACTTGGAAATTCAGGGCATCACCCGGGAGCAGTC 301 GIGCACTATICACAACCGGGICACCGGGIGGCCIGGCIAAACGGCAGCACCAICCTCTA 361 RECTEGERATERCAAGTGGTGCCTGGATCCTCGCGTGGTCCTTCTGAGCAAACCAAAC 421 GCAGTACAGCATCGAGATCCAGAACGTGGATGTGTATGACGAGGCCCTTACACCTGCTC 481 GGIGCAGACAGCACCACCAAAGACCICIAGGGICCACCICAIIGIGCAAGIAICICC GITGIGICCITCAGCAAAACAGIGGAITTAAAICTCCTTGCACAAGCTTGAGAGCAACAC AAGAAAAAATCATGAAAACCATCCAGCCAAAAATGCACAATTCTATCTCTTGGGCAAT 121 AAGAAAAAAACATGAAAACCATCCAGCCAAAAATGCACAATTCTATCTCTTGGGCAAT CTTCACGGGGCTGCTCTCTTCTTCCAAGGAGTGCCCCTGCGCAGCGGAATGC 181 CTTCACGGGGCTGGCTGCTGTGTCTCTTCCAAGGAGTGCCCGTGCGCAGCAGGAGTGC GIGCACTATIGACAACCGGGICACCCGGGIGGCCTGGCTAAACCGCAGCACCATCTTA GGTGCAGACAGACAACCAAAAGACCTCTAGGGTCCACCTCATTGTGCAAGTATCTCC Gaps Query Match

Novel isolated PRO polypeptide useful for tissue typing, gene therapy, molecular weight markers in protein electrophoresis, for treating arthritis, tumor.

Claim 2; SEQ ID NO 125; 308pp; English.

The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (I). PRO982. PRO1160. PRO1187 or PRO1329 polypeptide are

collegiul for stimulating the proliferation of or gene expression in

periotyce cells. PRO357, PRO3229. PRO1272 or PRO4405 polypeptide are useful

cor stimulating the proliferation of differentiation of chondrocyte

cells. PRO357, PRO357, PRO1255, PRO1306 or PRO1419 polypeptide

are useful for stimulating the release of tumour necrosis factor (TNF)
alpha from human blood. PRO982, PRO315, PRO1306, PRO1419, PRO1419,

New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or cancer.

Claim 2; Fig 375; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO solypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the color stimulating the presence of a tumour in a mammal (e.g. adremal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, in generating to polymucleotides are useful in molecular biology, in generating the prostate transgenic animals or knock-out animals which are colon breath of the propering should be presented in the development that screening or knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful setul as tumours, for antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothalal cells, for modulating the uptake of colluces or FPA (free fatty acid) by skeletal muscle cells for stimulating differentiation of adipocyte cells for stimulating proliferation of some expression in pericyte cells for stimulating verpoliferation of some expression in pericyte cells of treating various bone and/or cartilage disorders such as sports injuries and arrhititis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are also useful for treating sports-related joint arthritis. PRO polypeptides are also useful for treating various that associated disorders such as various themmanian haemoglobin-associated disorders such as various themmanian haemoglobin-associated disorders such as various cull infiltration. Note: The sequence of this patent is also available in

New PRO nucleic acid, useful for recombinantly producing a PRO polypeptide and for manufacturing a medicament for diagnosing or treating a tumor.

Claim 2; Fig 375; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The tinvention also relates to an antibody which specifically binds to a PRO polypeptide, a method for timulating the release of tumour necrosis factor-lapha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, no bolymucleotides are useful in molecular biology, including uses as hybridiation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also consistent in the development and screening of therapeutically useful to generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful creagents. The RNO polypeptides or antibodies are used in preparing or antibodies, such as tumours, for stimulating and inhibiting proliferation of or generating cells or adipocyte cells, for stimulating to groundleration of or generating ells or adipocyte cells, for stimulating cells, for stimulating cells, for stimulating cells, for inducing endothelial cell tube formation ells or T-lymphocyte cells, for inducing endothelial cell tube formation of or generating ells or activities and certain are sports injuries and certain are artificates such as sports injuries and carbities which artified such artificate the release of proteoglycans from cartilage are useful for treating sports-related joint problems,

articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polymucleotide of the invention. Note: The sequence data for this patent is also available in electronic format from USPIO at seqdata.uspto.gov/sequence.html.
                                                                                                                             9
                                                                                                                60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GCAGTACAGCATCGAGATCCAGAACGTGGATGTGTATGACGAGGCCCTTACACCTGCTC

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polypeptides encoding them.

The PRO polypeptides and polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, colon tumour, breast tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TMF) alpha from human blood, for stimulating the proliferation of or gene captocyte cells, for stimulating the proliferation of or gene expression in perioyte cells or stimulating the proliferation of or gene captocyte cells or stimulating the proliferation of or gene captocyte cells or for stimulating the proliferation of or gene captocyte in chromosome and gene mapping, in generating captocyte or stimulating the proliferation of or gene antisense RNA and DNA, in preparing PRO polypeptides by recombinant captocyte, in generating transgenic animals or knock-out animals which captons, in gene therapy, in chromosome identification, as chromosome markers and in generating probes. The PRO polypeptides, or anti-PRO cantibodies, such as perioyte-associated tumours and one and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. The sequence captence at a numan PRO polypeptide of the invention. Note:

The sequence data for this patent can also be obtained in electronic format directly from USPTO at seqdata.uspto.goc/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

                                                                                                                                                                                                                                                                                                       The invention describes an isolated PRO (secreted and transmembrane) polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are useful for stimulating the pro11feration of or gene expression in perioyre cells. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are useful

The invention describes an isolated PRO (secreted and transmembrane)

CC polypeptide (I). PRO992, PRO1160, PRO1187 or PRO1329 polypeptide are

cuseful for stimulating the proliferation of or gene expression in

CC cells. PRO357, PRO329, PRO1272 or PRO4405 polypeptide are useful

certain pro31, PRO357, PRO325, PRO1155, PRO1366 or PRO4419 polypeptide

CC are useful for stimulating the release of tumour necrosis factor (INF)-

alpha from human blood. PRO982, PRO357, PRO136, PRO1419, PRO1419,

CC PRO134, PRO137, PRO365, PRO185, PRO180, PRO1419, PRO1419,

CC PRO134, PRO134, PRO1367, PRO1805, PRO1444, PRO1411, PRO1309,

CC PRO134, PRO136, PRO1366, PRO1966, PRO1444, PRO1411, PRO1309,

CC PRO134, PRO1376, PRO1367, PRO1409, PRO1474, PRO1411, PRO1309,

CC PRO134, PRO136, PRO1361, PRO1409, PRO1474, PRO1560, PRO1366,

CC PRO1376, PRO1364, PRO1409, PRO1474, PRO191760, PRO1567,

CC STIMULATING The DRO116 arial human dermal fibroblasts cells.

CC STIMULATING The proliferation of normal human dermal fibroblast cells.

CC Collypeptides such as PRO6104, PRO491, PRO5778, PRO4332, etc.,

CC COLLY PROSECTING the prosence of tumour in a mammal which

cr unseful for detecting the presence of tumour in a mammal which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gerritsen ME, Goddard A, Godowski PJ;

| in a test sample of cells taken from the mammal, and a control sample of normal cells of the same cell type, where a higher level of expression of the PRO polypeptides in the test sample as compared to the control sample is indicative of the presence of tumour in the mammal. The tumour is lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers for tissue typing, or as therapeutic agents. A polymucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO357, PRO229, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This sequence encodes a human secreted and transmembrane PRO polypeptide. | Query Match 3est Local Similarity 100.0%; Pred. New PRO polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, chromosome identification, tissue typing, or as hybridization probes in chromosome and gene mapping.

Claim 2; SEQ ID NO 125; 308pp; English

The invention describes an isolated PRO (secreted and transmembrane)

C polypeptide (1). PRO982, PRO1160, PR01187 or PR01292 polypeptide are
c useful for stimulating the proliferation of or gene expression in
c useful for stimulating the proliferation of or PR01292 polypeptide are useful
CC calls. PR031, PR0357, PR0125, PR01155, PR01406 polypeptide are useful
CC calls. PR031, PR0315, PR01155, PR01156, PR01419 polypeptide
CC calls. PR031, PR03157, PR01155, PR01166, PR01419 polypeptide
CC are useful for stimulating the release of tumour necrosis factor (TNP)CALPADA FR0181, PR0826, PR01831, PR01815, PR01816, PR01811, PR01819,

The invention describes an isolated PRO (secreted and transmembrane)

CC polygeptide (1). PRO932, PRO1160, PRO1187 or PRO1329 polypeptide are
useful for stimulating the proliferation of or gene expression in

CC ceris the pro121, PRO223, PRO225, PRO1272 or PRO4405 polypeptide are useful

CC estimulating the proliferation or differentiation of chondrocycle

New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or cancer. WPI; 2004-020237/02. P-PSDB; ADD87925.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymuclectides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for colon, breast, prostate, rectal, kidney, cervical and liver tumours). The olymuclectides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating on the used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of the reagents. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or medicament for treating a condition responsive to the polypeptides or

antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothalial cells, for modulating the uptake of glucoseo or FRA by skeletal muscle cells, for modulating the uptake of cluscose or FRA by skeletal muscle cells, for stimulating to trimulating differentiation of adjocyte cells, for stimulating proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and carthities. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, arthoriar cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human PRO polynucleotide of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at sequence.html. 120 120 180 180 240 240 300 300 360 360 420 420 480 480 540 540 600 9 9 99 720 9 9 1 GTTGTGTCCTTCAGCAAAAAGTGGATTTAAATCTCCTTGCACAAGCTTGAAGAACAC 301 GTGCACTATTGACAACCGGGTCACCCGGGTGGCCTGGCTAAACCGCAGCACCATCCTCTA 361 IGCTGGGAATGACAAGTGGTGCCTGGATCCTCGCGTGGTCCTTCTGAGCAACACCCAAAC 541 CAAAATTGTAGAGATTTCTTCAGATATCTCCATTAATGAAGGGAACAATATTAGCCTCAC CTGCATAGCAACTGGTAGACCAGAGCCTACGGTTACTTGGAGACACATCTCTCCCCAAAGC 661 GGTTGGCTTTGTGAGTGAAGACGAATACTTGGAAATTCAGGGGATCACCGGGGAGCAGTC 1 GITGIGICCTICAGCAAAACAGIGGAITITAAAICTCCTIGCACAAGCITGAGAGCAACAC 181 CTTCACGGGGCTGGCTGCTGTGTCTCTTCCAAGGAGTGCCCGTGCGCAGCAGGAGTGC 241 CACCTTCCCCAAAGCTATGGACAACGTGACGGTCCGGCAGGGGGAGAGCGCCCACAG 241 CACCTTCCCCAAAGCTATGGACAACGTGACGGTCCGGCAGGGGAGAGAGGCGCCACCCTCAG TGCTGGGAATGACAAGTGGTGCCTGGATCCTCGCGTGGTCCTTCTGAGCAACACCCAAAC CAAAATTGTAGAGATTTCTTCAGATATCTCCCATTAATGAAGGGAACAATATTAGCCTCAC CTGCATAGCAACTGGTAGACCAGAGCCTACGGTTACTTGGAGACACACATCTCTCCCAAAGC 181 CTTCACGGGCTGGCTGCTCTGTGTCTCTTCCAAGGAGTGCCCGTGCGCAGGGAGATGC 301 GIGCACIATIGACAACCGGGICACCCGGGIGGCCTGGCTAAACCGCAGCACCATCCTCTA GCAGTACAGCATCGAGATCCAGAACGTGGATGTGTATGACGAGGGCCCTTACACCTGCTC Gaps ö 100.0%; Score 1679; DB 1; Length 1679; 100.0%; Pred. i or New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO1114 PRO4978, useful in molecular biology, chromosome and gene mapping, generating antisense RNA and DNA, and in gene therapy.

Claim 2; Fig 375; 637pp; English

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis conjugation of the stimulating the presence of a tumour in a mammal (e.g. adread, lung, corporate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as the polymucleotides may also artisense RNA and BNA and in gene therapy. The polymucleotides may also constitued in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening or knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening of knock-out animals which are useful in the development and screening or the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or attributions, souch as tumours, for stimulating of himbiting proliferation of thuman microvascular endothelial cells, for modulating the uptake of stimulating differantiation of adapocyte cells, for stimulating proliferation of since expression in periorye cells, for stimulating cells or T-lymphocyte cells, for inducing endothelial cells or adipocyte cells, for stimulating defects, orteoarthritis and rheumatoid arthritis. PRO oblypeptides which stimulate such as sports injuries and condition. The sequence are useful for treating various mammalian hemoglobin-center sequence represents a human PRO plymuleotide of the invention. The sequence represents a busic parting and influence of the invention. The sequence represents in t

                                                                                                                                                                                                                                                                transmembrane polypeptides) and the PRO polymucleotides encoding them.

The PRO polypeptides and polymucleotides are useful as pharmaceuticals, detecting tumours for a biosensors or bioreactors. They are particularly useful for detecting tumours or biosensors or bioreactors. They are particularly useful for detecting tumours or liver tumour, breast tumour, colon tumour, breast tumour, for stimularing the release of tumour necrosis factor (TNP)-alpha from human blood, for stimulating the proliferation of chondrocyte cells, for stimulating the proliferation of or gene commal human dermal fibroblasts. The PRO nucleic acids are useful as normal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating transgenic animals which captures RNA and DNA, in preparing PRO polypeptides by recombinant celhology, in generating transgenic animals of therapeutically useful creagents, in gene therapy, in chromosome identification, as chromosome markers, and in generating probes. The PRO polypeptides or anti-PRO condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the recomplication of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polypeptides are useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polynucleotides encoding them.

The PRO polypeptides and polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TMF)-alpha from human blood, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene cormal in periors continual the proliferation of normal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating cholidisation probes, in preparing PRO polypeptides by recombinant technology, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful reagents, in gene therapy, in chromosome identification, as chromosome

markers and in generating probes. The PRO polypeptides, or anti-PRO antibodies, are useful for preparing a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as perioyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polymucleotide of the invention. Note: The sequence data for this patent is also available in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  540

New secreted and transmembrane PRO polypeptide and nucleic acid encoding it, for use in gene therapy, as diagnostic markers for the presence of a disease condition, or as therapeutic targets for treating tumors, diabetes, or arthritis.

Claim 2; Fig 375; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TWF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, confidentiation of chondrocyte cells and a method for polypeptide presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast brobbe, in chromosome and gene mapping, in generating colon probes, in chromosome and gene mapping, in generating colon probes, in chromosome and gene mapping, in generating colon probes, in chromosome and gene mapping, in generating colon probes, in the development and screening of kerzapurical lungers and in the development and screening of kerzapurical properties of colon probes, in the development and screening of kerzapurical lungers are used in preparing a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or colon bund microvascular endothelial cells, for modulating the uptake of grounds of colon properties of such and properties cells, for stimulating differation of or gene expression in periore cells, for stimulating colon properties of antipocyte cells, for stimulating colon properties and colon properties and colon properties and colon properties and colon properties cells, colon colon properties and colon properties and colon properties cells, colon colon properties and colon properties of properties and colon properties of the requence data for this patent

2004-008994/01. P-PSDB; ADE48857 New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO4993 or PRO337, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

Claim 2; SEQ ID NO 522; 460pp; English.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to a manno acid sequence floose from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising comprising the vector and producing PRO, a chimaeric molecule comprising antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide is useful for detecting PRO337 polypeptide is useful for detecting PRO325, PRO700 or PRO139 polypeptide is useful for detecting PRO725, PRO700 or PRO139 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO493 polypeptide. The bioactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bloactive molecule is useful for linking a bloactive molecule is useful for modulating at least one biological activity of the cell expressing PRO493 polypeptide is useful for modulating at least one biological activity of the cell expressing PRO493 polypeptide, where the cell is killed PRO4337

polypeptide or anti-PRO4993 polypeptide is useful for modulating the biological activity of the cell expressing PRO493 polypeptide; PRO725, PRO700 or PRO739 polypeptide or an anti-PRO1559 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide; and PRO1559 polypeptide or anti-PRO775, anti-PRO700 or anti-PRO739 polypeptide; and PRO1559 polypeptide or anti-PRO775, anti-PRO700 or anti-PRO739 polypeptides are useful for modulating the biological activity of the cell expressing PRO725, pRO700 or PRO739 polypeptide. The polypeptides are useful for inhibiting tumour growth, retinal disorders, sports-related joint problems, articular cartilage defects, osteoarthitis or rheumatoid arthritis, wound healing and hearing loss in mammals. The present sequence encodes a PRO protein. 88888888888888888

New PRO polypeptide and nucleic acid encoding the polypeptide, useful gene therapy, chromosome identification, tissue typing, or as hybridization probes in chromosome and gene mapping.

Claim 2; SEQ ID NO 125; 309pp; English

The invention describes an isolated PRO (secreted and transmembrane)

CD polypeptide (1). PRO932, PRO1160, PRO1187 or PRO1329 polypeptide are
useful for stimulating the proliferation of or gene expression in

CD periotye cells. PRO357, PRO222, PRO1272 or PRO4465 polypeptide are useful

CD estimulating the proliferation of differentiation of chondrocyte

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO205 or PRO214, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and for treating disorders involving anglogenesis.

The invention relates to an isolated nucleic acid encoding a secreted and transmembrane polypeptide (PRO). The nucleic acid, a polypeptide encoded transmembrane polypeptide (PRO). The nucleic acid, a polypeptide encoded by the nucleic acid, or an agonist or antagonist, is used to treat a cardiovascular, endothelial, or angiogenic disorder in a mammal, preferably a human. The human may have suffered a myocardial infarction or has cardiac hypertrophy, trauma, a cancer, or age-related macular of degeneration. The cardiac hypertrophy is characterised by the presence of an elevated level of PGP-2 alpha. A PRO polypeptide, given in the second of properties is used to inhibit or stimulate endothelial cell apoptosis. A PRO propertied prowth in a mammal. PRO1499 is used to stimulate angiogenesis. PRO4302 or an agonist is used to induce endothelial cell apoptosis. A PRO polypeptide, given in the specification, or an agonist is used to simulate and inhibit smooth muscle cell growth, or to induce endothelial cell uppetide of the invention. The present sequence represents a cDNA encoding a constant of the invention. Claim 2; SEQ ID NO 55; 492pp; English

```
The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the carecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridiation probes, in chromosome and gene mapping, in generating antisense RNA and bNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in color useful in the development and screening of therapeutically useful the development and screening of therapeutically useful captulate to the PRO polypeptides or antibodies are used in preparing a complication and screening of therapeutically useful captudies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for modulating the uptake of slucose or FRA by skeletal muscle cells or adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating cells, for stimulating coliferation of or gene expression in pericyte cells, for stimulating clies or T-lymphocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or

                                                                                                                                                                                                                                                                                                                                                                                                                                 240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       840
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   840
various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian hamoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence encodes a human PRO polypeptide of the invention. Note: The sequence data for this patent is also available in electronic format from the USPTO website at segdata.uspto.gov.
                                                                                                                                                                                                                                                                                                                   120
                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                         180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               540

Human; secreted and transmembrane protein; PRO; gene; ss; cytostatic; vulnerary; antiarthritic; pericyte cell proliferation; pericyte cell differentiation; chondrocyte cell proliferation; chondrocyte cell differentiation; tumour necrosis factor alpha release; (TNF) - alpha release; dermal fibroblast cell proliferation;

The invention describes an isolated PRO (secreted and transmembrane)

CDOJYPEPLIGE (1). FR0292, PR01160, PR01187 or PR01329 polypeptide are

useful for stimulating the proliferation of or gene expression in

CC estimulating the proliferation or differentiation of chondrocycle

cells. PR0231, PR0225, PR01255, PR01155, PR01196, PR01419, PR01419,

```

The invention describes an isolated PRO (secreted and transmembrane) polypeptide (1). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are useful for stimulating the prollecation of or gene expression in paricyte cells. PRO387, PRO229, PRO1272 or PRO4405 polypeptide are useful for stimulating the proliferation or differentiation of chondrocyte

Claim 2; Fig 125; 308pp; English.

CC PRO1343, PRO1376, PRO1361, PRO1313, PRO1344, PRO1321,
CC PRO1343, PRO1364, Or PRO1065 polypeptide are useful for
cc stimulating the proliferation of normal human dermal fibroblasts cells.
CC PRO523, PRO5725, PRO7154, Or PRO7425 polypeptide are useful for
cc inhibiting the proliferation of normal human dermal fibroblast cells.
CC PRO523, PRO5725, PRO7154, Or PRO7425 polypeptide are useful for detecting the presence of tumour in a mammal which
cc inhibiting the proliferation of normal human dermal fibroblast cells.
CC polypeptides such as PRO6004, PRO4991, PRO7734, PRO5732, PRO4322,
CC c are useful for detecting the presence of tumour in a mammal which
cc involves comparing the level of expression of the above PRO polypeptides
cn ormal cells of the same cell type, where a higher level of expression of
cumour, colon tumour, breast tumour, prostate tumour, rectal tumour or
cuseful for chromosome and gene mapping or gene therapy. (II) is useful
cc typing, or as therapeutic agents. A polynuclectide (II) encoding (I) is
cuseful for chromosome and gene mapping or gene therapy. (II) is useful
cc secening useful reagents. PRO357, PRO327, PRO405 polypeptide
cs substill for treatling bone and/or cartilage disorders (e.g., arthritis,
cc sport injuries). This sequence encodes a human secreted and transmebrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           300

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polymucleotides encoding them.

Cr The PRO polypeptides and polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, colon tumour, breast tumour, rectail tumour or liver tumour) in ammman! for stimulating the release of tumour necrosis factor (TNF) alpha from human conforce of tumour necrosis factor (TNF) alpha from human conforce of tumour necrosis factor (TNF) alpha from human conforce of tumour necrosis factor (TNF) alpha from human commal human dermal fibroblasts. The PRO nucleic acids are useful as hybridiation probes, in chromosome and gene mapping, in generating transgenic animals or knock-out animals which can be used in the development and screening of therapeutically useful cragents, in gene therapy, in chromosome identification, as chromosome madedens, such as pericyte associated tumours and bone and/or cartinage condition which is responsive to the PRO polymeptides or anti-PRO antibodies, such as pericyte associated tumours and bone and/or cartinage disorders (e.g. arthritis, sports injuries), involving inducing the rectilisements for protein electrophoresis, and in tissue typing. The sequence represents a human PRO polymucleotide of the invention. Note:

Cr sequence represents a human PRO polymucleotide of the invention. Note:

Cr sequence data for this patent is also available in electronic format

New secreted and transmembrane PRO polypeptide useful for preparing medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. cancer.

Claim 2; Fig 125; 308pp; English.

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polypeptides encoding them.

The PRO polypeptides and polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful is parameditude tumours, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour nercosis factor (TNF) alpha from human blood, for stimulating the proliferation of or gene capression in pericyte cells or for stimulating the proliferation of conditroyte cells, for stimulating the proliferation of conditroys in pericyte cells or for stimulating the proliferation of conditronses RNA and DNA, in preparing PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating properties or chromosome identification, as chromosome condition which is responsive to the PRO polypeptides by recombinant centuind probes. The PRO polypeptides or anti-PRO antibodies, are useful for preparing a medicament for treating and encoding probes. The PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartinage condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartinage discorders (e.g. arthritis, sports injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. The sequence expresents a human PRO polypeptide are useful as condaring a human PRO polypeptide size are useful as the process of the process of the invention. Ø New secreted and transmembrane PRO polypeptide useful for preparing medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. cancer.

Claim 2; Fig 125; 309pp; English.

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polymucleotides encoding them.

The PRO polypeptides and polymucleotides encoding them. They are perticularly useful for diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, perstate tumour, reclai tumour or liver tumour) in a mammal, for prostate tumour, reclai tumour necrosis factor (TNF)-alpha from human blood, for stimulating the proliferation of or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells or for stimulating the proliferation of normal human dermal fibroblasts. The PRO nucleic acids are useful as the human dermal fibroblasts. The PRO nucleic acids are useful as the human dermal fibroblasts. The PRO nucleic acids are useful as the hypidisation probes, in chromosome and gene mapping, in generating transgenic animals or knock-out animals which RESULT 142

may be used in the development and screening of therapeutically useful reagents, in gene therapy, in chromosome identification, as chromosome markers and in generating probes. The PRO polypeptides, or anti-PRO antibodies, are useful for preparing a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO disorders, such as perioyte-associated tumours and hone and/or cartilage disorders, such as perioyte-associated tumours and hone and/or cartilage disorders (e.g. arthritis, sports injuncies), involving inducing the inflerentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typhing. This sequence represents a human PRO polynucleotide of the invention. Novel human secreted and transmembrane protein PR0337 cDNA ADD76064 standard; cDNA; 1679 BP (first entry) 29-JAN-2004 ADD76064; RESULT 143

vulnerary; antiarthritic; pericyte cell proliferation; pericyte cell differentiation; chondrocyte cell proliferation; chondrocyte cell differentiation; tumour necrosis factor alpha release; human; secreted and transmembrane protein; PRO; gene; ss; cytostatic;

The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (1). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are
useful for stimulating the proliferation of or gene expression in

pericyte cells. PRO357, PRO229, PRO1155, PRO1405 polypeptide are useful

for stimulating the proliferation or differentiation of chondrocyte

cells. PRO231, PRO357, PRO1255, PRO1136, PRO1419, PRO1419,

Alpha from human blood. PRO0185, PRO1155, PRO1136, PRO1419, PRO1419,

CC Inhibiting the proliferation of normal human dermal fibroblast cells.

CC Dolypeptides anch as PRO6004, PRO4981, PRO7174, PRO5778, PRO4488,

CC C Inhibiting the proliferation of normal human dermal fibroblast cells.

CC C Are useful for descring the presence of tumour in a mammal mammal mammal.

CC C Inver tumour, Lumour, Prosession of the above PRO polypeptides in the test sample of cells tampe as compared to the control sample of sindicative of the presence of tumour in the mammal. The tumour is lung

CC Unseful for chromosome and gene mapping or gene therapy. (II) is useful as molecular weight markers, for tissue

CC C SCREEDING USER ALT AND ALT ALT AND ALT ALT AND ALT ALT ALT A New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, or for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. PJ; Wood WI; tumour; (TNF)-alpha release, dermal fibroblast cell proliferation; dermal fibroblast cell differentiation inhibitor; tumour; lung colon tumour; breast tumour; prostate tumour; rectal tumour; lissue typing; chromosome mapping; gene mapping; Gerritsen ME, Goddard A, Godowski P Smith V, Stephan JF, Watanabe CK, Claim 2; SEQ ID NO 125; 308pp; English. 13-AUG-2002; 2002US-00219467. 01-JUN-2001; 2001WO-US017800. 29-JUN-2001; 2001WO-US021066. 09-APR-2002; 2002US-00119480. WPI; 2004-008971/01. P-PSDB; ADD85557.

New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, or for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. cancer.

Claim 2; SEQ ID NO 125; 308pp; English.

The invention describes an isolated PRO (secreted and transmembrane)

Dolypeptide [1]. PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are

Dolypeptide [1]. PRO982, PRO1160, PRO1187 or PRO4132 polypeptide are

CC described and the proliferation of condincover are useful

CC stimulating the proliferation of differentiation of chondrocyte

cells. PRO357, PRO525, PRO1305, PRO1419 polypeptide

are useful for stimulating the release of tumour necrosis factor (TNP)
are useful for stimulating the release of tumour necrosis factor (TNP)

New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or

480

421

Claim 2; Fig 375; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) From human blood, a method for stimulating the polypeptide, a method for stimulating the presence of a tumour in a mammal (e.g adrenal, lung, coroliferation or differentiation of chondrocyte cells and a method for chynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating an atleasmes RNA and bno polypeptides by recombinant techniques and in generating propolypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful cueful in the development and screening of therapeutically useful cueful in the development and screening of therapeutically useful antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular andothelial cells, for modulating the uptake of glucose or FRA by skeletal muscle cells, for modulating the uptake of glucose or FRA by skeletal muscle cells, for stimulating differentiation of angipocyte cells, for stimulating cells or T-lymphocyte cells, for inducing endothelial cells or adjpocyte cells, for stimulating cells or trading cells or trading ear useful for treating sports injuries and cartings are useful for treating sports related joint problems, articular cartilage are useful for treating various mammalian hammoglobinces are subscitled for a various thalassaemias and condition. Note: The sequence encodes a human PRO polypeptide of the invention. Note: The sequence encodes a human PRO polypeptide of the invention.

New secreted and transmembrane nucleic acid useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome, or cancer.

Claim 2; Fig 375; 637pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as polynucleotides are useful in molecular biology, including uses as polynucleotides are useful in molecular biology, including uses as this ensure RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating eliber transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or

of human microvascular endothelial cells, for modulating proliferation of human microvascular endothelial cells, for modulating the uptake of glucose or FRA by skeletal musche cells or adhporter cells, for clumulating differentiation of adhporter cells, for stimulating proliferation of or gene expression in pericyte cells, for stimulating proliferation of inner ear utricular supporting cells or T-lymphocyte cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, propeptides are also useful for treating various mammalian haemoglobin—sesociated disorders such as various thalsassemias and conditions which may benefit from enhanced local immune system cell infiltration. in or New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO1114 PRO4978, useful in molecular biology, chromosome and gene mapping, generating antisense RNA and DNA, and in gene therapy.

Claim 2; Fig 375; 648pp; English

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNT-alpha) from human blood, a method for stimulating the prosence of a tumour in a membal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidhey, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating ather transgenic animals or knock-out animals which are used in preparing by polypeptides by recombinant techniques and in generating ather transgenic animals or knock-out animals which are used in preparing at medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of the such as tumours, for stimulating and inhibiting proliferation of the proliferation of adipocyte cells, for stimulating the uptake of stimulating differentiation of adipocyte cells, for stimulating collections and containing sports injuries and celling proliferation of or gene expression in periote cells, for stimulating collections and containing sports injuries and articular cartilage defects, otherating sports related joint problems, articular cartilage defects, otherating various mannalian haemoglobin associated disorders such as various thalassaemias and conditions which may benefit from enhanced local inmune system cell infiltration. New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, or for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g.

Claim 2, Fig 125, 308pp, English

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polymuclectides encoding them.

The PRO polypeptides and polymuclectides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for prostate tumour, reclaid tumour or liver tumour, breast tumour, prostate tumour, calls the proliferation of prostate tumour or liver tumour) in amammal, for prostate tumour calls, for stimulating the proliferation of differentiation of chood, for stimulating the proliferation of or gane capression in pericyte calls or for stimulating the proliferation of or gane ormal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating transgenic animals or knock-out animals which captures and in generating transgenic animals or knock-out animals which reagents, in generating probes. The PRO polypeptides by recombinant reagents, in generating probes. The PRO polypeptides, or anti-PRO antibodies, are useful for preparing a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage differentiation of chondrocytes. The PRO polypeptides are useful as markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polymeptides are useful as markers and in such a human PRO polymeptides are useful as pericyte-associated tumours and in tissue typing. This

New secreted and transmembrane PRO polypeptide useful for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. cancer.

Claim 2; SEQ ID NO 125; 308pp; English.

The invention describes an isolated PRO (secreted and transmembrane)

CC polypeptide (1). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are
useful for stimulating the proliferation of of gene expression in
Descripte ceals. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are
useful for stimulating the proliferation or differentiation of chondrocyte

The invention describes an isolated PRO (secreted and transmembrane)

CC polypeptide (1). PRO932, PRO1160, PRO1187 or PRO1252 polypeptide are useful for stimulating the proliferation of or gene expression in useful for stimulating the proliferation of differentiation of chondrocyce cells. PRO357, PRO725, PRO1155, PRO1155, PRO1150, PRO1150, PRO1150, PRO1151, PRO

Gao W;

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TWP-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adrenal, lung, coliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polynucleotides are useful in molecular bology, including uses as in the according to the polynucleotides and also are used in preparing PRO polypeptides by recombinant techniques and in preparing PRO polypeptides by recombinant techniques and in reagents. The PRO polypeptides or knock-out animals which are considered in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing of the properting colition responsive to the polypeptides or medicament for treating entimals ing of the modulating the uptake of glucose or FRA by skeltal muscle cells, for modulating the uptake of glucose or FRA by skeltal muscle cells, for modulating the uptake of simulating of finer ear utricular supporting cells, for stimulating the proliferation of adjocyte cells, for stimulating cells or actilage and end/or cartilage disorders such as sports finulating arthritis. PRO polypeptides which stimulate the release of proceoglycane from cartilage are useful for treating sports related joint problems, arthritis. PRO polypeptides which stimulate the release of proceoglycane from cartilage are useful for treating sports related joint problems, arthritis. PRO polypeptides which stimulate and also useful for treating sports and network from enhanced loss immune system cells, for may benefit from enhanced loss immune system cells in internor. The sequence represents a hum

New isolated, secreted and transmembrane PRO polypeptides and nucleic acids, useful for diagnosing, preventing and/or treating diabetes mellitus and tumors, such as renal, colon, breast, prostate and/or ovarian tumors.

Claim 1; SEQ ID NO 103; 259pp; English.

The invention relates to an isolated secreted/transmembrane PRO polypeptide. The polypeptide and its nucleic acid is useful as an inhibitor of vascular endothelial growth factor stimulated proliferation of endothelial cells, as a stimulator of T-lymphocyte proliferation, as an inducer of endothelial cells apoptosis, c-fos and differentiation of pancreatic beta cell precursors into mature cell, for induction of redifferentiation and/or proliferation of chondrocytes and for modulating glucose or free fatty acid (FFA) uptake by skeletal muscle cells. The polypeptide and its nucleic acid is useful for generating transgenic or knock-out animals, for tissue typing and for chromosome identification. The polypeptide is useful in a number of functional biological assays, as molecular weight marker for protein electrophoresis, and as therapeutic denomeneand gene mapping, in the generation probe in chromosome and gene mapping, in the generation of antisense RNA and DNA, and for the preparation probe for a cDNA library to isolate the full length PRO cDNA, to isolate other cDNA and in gene therapy. The nucleic acid is also useful to the construction of hybridisation probes for mapping the gene conductor the genetic disorders. The present sequence represents a cDNA encoding a conductor of individuals with the genetic disorders. The present sequence represents a cDNA encoding a human secreted/transmembrane PRO polypeptide.

WPI; 2004-021079/02. P-PSDB; ADE18378.

New isolated nucleic acid encoding a PRO polypeptide, e.g. PROII14 or PRO4978, for use in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

Claim 2; SEQ ID NO 375; 638pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adremal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as thy byridisation probes, in chromosome and gene mapping, in generating colon, breast, prostated in gene therapy. The polymucleotides may also a setul in the development and screening or knock-out animals which are consecuted in the development and screening or knock-out animals which are useful in the development and screening or knock-out animals which are useful in the development and screening or knock-out animals which are useful in the development for treating a condition responsive to the polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or multipodies are used in preparing a condition of stimulating and inhibiting proliferation of stimulating of thuman microvascular endothelial cells, for modulating the uptake of glucose or FRA by skeletal muscle cells or adipocyte cells, for stimulating differation of inner ear utrivinal responsive cells, for stimulating and confidenting cells or T-lymphocyte cells, for medication and for treating confidential properties or treating early stimulate and carthritis. PRO polypeptides which stimulate such as sports injuries and carthritis. PRO polypeptides which stimulassaemias and condition. Note: colls, come cartiage defects, osteoarthritis and rhemmedial and condition. Note the sequence target or this patent is also vecided tor the manned local immune system cell infilteration. The sequence care or the pull

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the presence of a tumour in a mammal (e.g. adream). Lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The proliferation probes, in chromosome and gene mapping, in generating a hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and BNA and in gene therapy. The polymucleotides may also be used in preparing RNO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeurically useful cagents. The RNO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeurically useful cagents. The RNO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of thuman microvascular endothelial cells, for modulating the uptake of stimulating differentiation of adipocyte cells, for stimulating differentiation of adipocyte cells, for stimulating differentiation of since expression in pericyte cells, for stimulating and cothalial cell tube formation and for treating cells or t-lymphocyte cells, for inducing endothalial cell tube formation and for treating carting are useful for treating sports injuries and attribute are also useful for treating various mammalian hammaliane defects, osteoarthritis and rhemmeloid attributes are also useful for treating various mammalian hammaliane and as various thalassaemias and condition. The sequence represents a buman PRO polymulassaemias and conditions of the sequence data for

New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, or for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. cancer.

Claim 2; SEQ ID NO 125; 308pp; English.

The invention describes an isolated PRO (secreted and transmembrane)

CC polypeptide (1). PRO982, PRO1160, PRO1187 or PRO129 polypeptide are
useful for stimulating the proliferation of or gene expression in

CC testimulating the proliferation of differantiation of chondrocyte

for stimulating the proliferation of differantiation of chondrocyte

CC cells. PRO31, PRO35, PRO135, PRO135, PRO1306 or PRO1419, polypeptide

alpha from human blood. PRO815, PRO135, PRO1306, PRO1419, PRO1419,

CC Inhibiting the proliferation of normal human dermal fibroblast cells.

CC Inhibiting the proliferation of normal human dermal fibroblast colls.

CC Inhibiting the proliferation of normal human dermal fibroblast colls.

CC Inhibiting the proliferation of normal human dermal fibroblast colls.

CC CC Inhibiting the proliferation of normal human dermal fibroblast colls.

CC CC Inhibiting the prosence of tumour in a mammal with a mammal.

CC CC Inhibiting the prosence of tumour in a mammal with a mammal in the test sample of cells taken from the mammal, and a control sample of the presence of tumour in the mammal.

CC CC CLINGUL TUMOUR. (I) is useful as molecular weight markers, for tissue of tumour. (I) is useful as mole PRO polypeptide.

New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, or for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. cancer.

claim 2; SEQ ID NO 125; 308pp; English.

The invention describes an isolated PRO (secreted and transmembrans)

CC polypeptide (1) PRO982, PRO1160, PRO1187 or PRO1139 polypeptide are useful constitutional properties. PRO1819, PRO180, PRO1819, PRO1819,

```
The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polymucleotides encoding them. The PRO polypeptides and polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, present tumour, rectal tumour or liver tumour) in a mammal, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of cormal human dermal fibroblasts. The PRO mucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating chormal human dermal fibroblasts. The PRO mucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful centuchology, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful arkers and in generating probes. The PRO polypeptides or anti-PRO antibodies, are useful for preparing a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as periotyte-associated tumours and bone and/or cartiage disorders (e.g. arthitis, sports injuries), involving inducing the recombinant markers for protein electrophoresis, and in tissue typing. The sequence represents a human PRO polypeptides are useful sequence tepresents a human PRO polypeptides or anti-process sequence data for this patent is also available in electronic format
Human; PRO; gene; ss; secreted polypeptide; transmembrane polypeptide; tumour; cancer; lung; colon; breast; prostate; rectum; liver; tumour necrosis factor-alpha; TN-alpha; blood; chondrocyte cell; pericyte cell; dermal fibroblast; bone disorder; cartilage disorder; arthritis; sports injury; cytostatic; antiarthritic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New secreted and transmembrane PRO polypeptide useful for preparing medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gerritsen ME, Goddard A, Godowski PJ;

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polymucleotides encoding them.

The PRO polypeptides and polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, condition, rectal tumour or liver tumour) in amammal, for prostate tumour, rectal tumour or liver tumour) in amammal, for stimulating the release of tumour necrosis factor (TNP) alpha from human blood, for stimulating the proliferation of or gene expression in pericyte cells or for stimulating the proliferation of or gene expression in pericyte cells or for stimulating the proliferation of or gene expression in periosy in clumonsome and gene mapping, in generating attisense RNA and DNA, in preparing RNO polypeptides by recombinant continents, in gene therapy, in chromosome identification, as chromosome may be used in the development and screening of therapeutically useful cragents, in gene therapy, in chromosome identification, as chromosome markers and in generating probes. The PRO polypeptides or anti-PRO antibodies, such as perioyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducting the recondition which is responsive to the PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polymeticotide of the invention. Note:

The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence. Obtained in electronic condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120

the PRO polypeptides in the test sample as compared to the control sample is indicative of the presence of tumour in the mammal. The tumour is lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polymuclectide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO157, PRO129, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, PRO 1000) and transmembrane

The invention relates to human PRO polypeptides (secreted and the PRO polymorleotides encoding them. The PRO polymorleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumour, rectal tumour colon tumour, breast tumour, for stimulating the release of tumour necrosis factor (TNF) alpha from human of the release of tumour necrosis factor (TNF) alpha from human crimilating the proliferation of or gene conditoryte cells, for stimulating the proliferation of or gene expression in pericyte cells or for stimulating the proliferation of contangly in properties. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating transgenic animals or knock-out animals which can use and in the development and screening of therspectically useful cragents, in generating transgenic animals or knock-out animals which can be used in the development and screening of therspectically useful cragents, in generating probes. The PRO polypeptides, or anti-PRO markers and in generating probes. The PRO polypeptides or anti-PRO antibodies, are useful for preparing a medicament for treating the responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the re-disorders (e.g. arthritis, sports injuries), involving the re-disorder sequence represents a human PRO polypeptides are useful as condition which is responsive to the PRO polypeptides are useful as condition of chondrocytes. The PRO polypeptides are useful as condition and human PRO polypeptides are useful as the proposite of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CTTCACGGGGCTGGCTGTTCTCTTCTTCCAAGGAGTGCCCGTGCGCAGCGGAATGC 240

us-10-017-084a-522.rng

detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TNF) -alpha from human blood, for stimulating the proliferation of or gene chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells or for stimulating the proliferation of corpus probes, in chromosome and gene mapping, in generating antisense RNA and DNA, in preparing PRO polypeptides by recombinant technology, in generating transgenic animals or knock-out animals which artisense RNA and DNA, in preparing PRO polypeptides by recombinant companies, and in generating transgenic animals or knock-out animals which reagents, in gene therapy, in chromosome identification, as chromosome can been in the development and screening of therapeutically useful reagents, in gene therapy, in chromosome identification, as chromosome condition which is responsive to the PRO polypeptides, or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the recondition which arkers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polymetolectide of the invention. Note:

The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence. Other electronic can also be obtained in electronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence encodes a specifically claimed novel human protein. The novel human protein can be used in therapeutic drugs for the prevention and treatment of a broad range of disorders including autoimmune and infection-related immunodeficiency, inflammatory disorders, and neurological diseases. The novel protein is expected of having haematopoietic cell regularory activity, tissue generation/ reparation activity, activity, inhibin activity, taxis/chemotaxis activity, blood coagulation and thrombus activity, and receptor/ligand activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          184

The clone was initially identified in human foetal brain tissue. The invention provides novel SECX polynucleotides (see AAA88789-804) and the secreted or membrane-associated proteins encoded by them (see AAB19720-34). SECX polynucleotides, polypeptides and antibodies can be used in the detection, diagnosis and treatment (including gene therapy) of a broad range of pathological states
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SECX polypeptides and the nucleic acids that encode them, useful for diagnosing, preventing and treating e.g. cancers, inflammation, arthritis and immunological disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to novel human nucleic acid sequences which encode novel molecule (MOL) proteins numbered MOL1-23, referred to generally in the specification as MOLX. Compounds which modulate the function of the MOLX proteins of the invention, MOLX agonists or antagonists, may have cardiant, antidiabetic or antiatratiosclerotic activities. In addition, the DNA and protein sequences disclosed may prove useful for gene therapy. The protein, nucleic acid or antibody is useful for gene composition for treating or preventing a MOLX-associated disorder, for example cardiomyopathy, diabetes or atherosclerosis. The present sequence is the DNA sequence encoding a MOL protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         487

SECX polypeptides and the nucleic acids that encode them, useful for diagnosing, preventing and treating e.g. cancers, inflammation, arthritis and immunological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of SECX Clone 11753149.0.6, which resembles rat neural cell adhesion molecule neurotrimin and human opioid binding protein/Cell adhesion molecule OBCAM. The clone was initially identified in human feetal brain tissue. The invention provides novel SECX polymucleotides (see AA88789-804) and the secreted or membrane-associated proteins encoded by them (see AAB19720-34). SECX polymucleotides, polypeptides and antibodies can be used in the detection, diagnosis and treatment (including gene therapy) of a broad range of pathological states
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GTCCATAGAGACGAACAGAATGAGACCTTCCGGCCCCAAGCGTGGCGCTGCGGGCACTTTG

                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                          This invention relates to novel human nucleic acid sequences which encode novel molecule (MOL) proteins numbered MOL1-23, referred to generally in the specification as MOLX. Compounds which modulate the function of the MOLX proteins of the invention, MOLX agonists or antagonists, may have cardiant, antidiabetic or antiatreriosclerotic activities. In addition, the DNA and protein sequences disclosed may prove useful for gene therapy. The protein, nucleic acid or antibody is useful for gene therapy. The protein, nucleic acid or antibody is useful for preparing a composition for treating or preventing a MOLX-associated disorder, for example cardiomyopathy, diabetes or atherosclerosis. The present sequence is the DNA sequence encoding a MOL protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           582

The sequences of the invention are applicable in diagnosis and treatment of different kinds of tumour, haemopathy, HIV infection, nervous system disease, developmental disease, hereditary disease, endocrine system disease, immune system disease, immunological disease and various inflammations. This sequence represents cDNA encoding the human Kruppel associated DNA binding protein 42 109 120 AAGAAAAATCATGAAAAACCATCCAGCCAAAAATGCACAATTCTATCTTTGGGCAAT 180 229 213 289 213 349 169 Human, Kruppel associated DNA binding protein 42, gene, ss, cytostatic, virucide, immunomodulator, antiinflammatory, haemostatic; tumour; cancer, haemopathy, HIV infection, nervous system disease, developmental disease, hereditary disease; endocrine system disease, immune system disease, immune isystem disease, immunological disease, inflammation, human immunodeficiency virus. 9 Human Kruppel-associated DNA-binding protein 42 and encoded polynucleotide, applicable in diagnosis and treatment of developmental disorders, cancer, hemopathy, HIV infection, immunological diseases and various inflammations. binding protein GTTGTGTCCTTCAGCAAAACAGTGGATTTAAATCTCCTTGCACAAGCTTGAGAGCAACAC GITGTGTCCTTCAGCAAAACAGTGGATTTAAATCTCCTTGCACAAGCTTGAGAGCAACAC Gaps Indels 123; DB 1; Length 1873; Sequence 1873 BP; 563 A; 468 C; 471 G; 371 T; 0 U; 0 Other; DNA Location/Qualifiers 330. 1475 7-tag= a /product= "Human Kruppel associated | 42" Score 1571.3; DB 1; Pred. The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosupperseate and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous injuries, peripheral nervous costem, such as localised neuropathies and central nervous system diseases, such as lazheimer's, Parkinson's disease, Huntington's disease, amyotrophic collisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             282 CCGGCAGGGGAGAGCGCCACCCTCAGGTGCACTTTGACAACCGGGTCACCCGGGTGGC 341

Identifying a candidate p53 pathway modulators that are useful as targets for therapeutics or for diagnosing cancers associated with defective p53 function, by providing an assay system having a purified IG polypeptide or nucleic acid.
                                                                                                                                                                                                                                                                                The invention relates to a novel method for identifying a candidate p53 apthway modulating agent. The method comprises providing an assay system having a purified IG polypeptide or nucleic acid, or their functionally active fragment or derivative. The method is useful for identifying modulators of the p53 pathway, particularly for identifying agents for treating disorders (e.g. breast cancer, colon cancer, kidney cancer, lung cancer or cancer of the ovary) associated with defective p53 function. The identified modulators are useful as targets for novel therapeutics. The method is also useful for dispnosing disorders associated with defective p53 function. The IG proteins or nucleic acids are useful as modifiers of the p53 pathway, and as therapeutic targets for disorders associated with defective p53 function. This polynucleotide sequence represents a human nucleic acid relating to the human IG genes used in the assay for identifying modulators of the p53 pathway of the invention
                                                                                                                                                                                                                                                           Example; Page 170-171; 248pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ठे
```

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer casciated polymucleotides and polymeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating a modulatory compound identified. The methods are useful contracting a modulatory compound identified. The methods are useful contracting to other benign or precancerous lessions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary discosis, asthma and confinentials. The genes, polymucleotides and polypeptides are useful compounds that modulate lung cancer, such as antibodies. Sequences compounds that modulate lung cancer, such as antibodies. Sequences Lung cancer-associated polynucleotide; gene; ds; cytostatic; emphysema; antinflammatory; antiasthmatic; non-small cell lung cancer; atelectasis; small cell lung cancer; benign lesion; precancerous lesion; bronchitis; chronic obstructive pulmonary disease; hypersensitivity pneumonitis; interstitial pulmonary fibrosis; fibrosis; asthma; bronchiectasis. Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer. 345 AGGAGTGCCCGTGCGCAGCGGAGATGCCACCTTCCCCAAAGCTATGGACAACGTGACGTGACGG 214 AGGAGTGCCCGTGCGCAGCGGAGATGCCACCTTCCCCAAAGCTATGGACAACGTGACGGT Gaps 20; Length 1839; Sequence 1839 BP; 464 A; 506 C; 503 G; 366 T; 0 U; 0 Other; 85.9%; Score 1442.8; DB 1; Length 98.5%; Pred. The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide or for the invention may be used to treat diseases of the peripheral nervous spaces, such as system, such as peripheral nervous injuries, peripheral nervous sinjuries, peripheral nervous contained neuropathy and localised neuropathies and central nervous system disease, such as laceins scheral sclerosis, and Shy-Drager Syndrome, Other uses include the utilisation of the activities such as Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolyty carlot diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemiss and c.N.S disorders. Note: The sequence data for this patent did not form bart of the printed specification
                                                                                                                                                                                                                                                                                                                                                            400
                                                                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                                                                     460
                                                                                                                                                                                                                                                                                                                                                                                                                                                 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CTGCATAGCAACTGGTAGACCAGAGCCTACGGTTACTTGGAGACACATCTCTCCCCAAAGC 1000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

Tue Jun

```
The present sequence encodes a specifically claimed novel human protein. The novel human protein can be used in therapeutic drugs for the prevention and treatment of a broad range of disorders including autoimmune and infection-related immunodeficiency, inflammatory disorders, and neurological diseases. The novel protein is expected of maving heamatopoietic cell regulatory activity, issue generation, reparation activity, activity, activithinian activity, taxis/chemotaxis activity, blood coagulation and thrombus activity, and receptor/ligand activity
                                                                                                                New polypeptides of human origin having cell regulatory, tissue generation, coagulant and other activities.
